Applicant : Nicholas T. Lange Attorney's Docket No.: 04843-046001 / MCL 2558

Serial No.: 10/823,816 Filed: April 14, 2004 Page: 2 of 13

## Amendments to the Claims:

This listing of claims replaces all prior versions and listings of claims in the application:

## Listing of Claims:

 (Currently Amended) A method for estimating a value of a diffusion tensor, said method comprising:

obtaining, from a plurality of test subjects, DT-MRI data from which an initial estimate of the tensor can be derived;

determining a first value indicative of intra-subject variation[8] in said data; determining a second value indicative of inter-subject variation in said data; and

at least in part on the basis of said first and second values, determining a subject-specific additive offset for adjusting said DT-MRI data.

- (Original) The method of claim 1, further comprising generating adjusted data by adjusting said DT-MRI data by said offset.
- (Original) The method of claim 2, further comprising generating a bowtie plot from said adjusted data.
- 4. (Original) The method of claim 1, further comprising selecting said DT-MRI data to represent an initial estimate of said diffusion tensor value.
- (Original) The method of claim 1, further comprising selecting said DT-MRI data to represent echo data from which an initial estimate of the diffusion tensor can be derived.

(Original) The method of claim 1, wherein determining a first value comprises
determining an average intra-subject variance.

- (Original) The method of claim 1, wherein determining a second value comprises
  determining an inter-subject variance.
- 8. (Currently Amended) A computer-readable medium having encoded thereon software for estimating a value of a diffusion tensor, said software comprising instructions for:

obtaining, from a plurality of test subjects, DT-MRI data from which an initial estimate of the tensor can be derived;

determining a first value indicative of intra-subject variation[s] in said data;

determining a second value indicative of inter-subject variation in said data; and

at least in part on the basis of said first and second values, determining a subject-specific

additive offset for adjusting said DT-MRI data.

- (Original) The computer-readable medium of claim 8, wherein the software further comprises instructions for generating adjusted data by adjusting said DT-MRI data by said offset.
- 10. (Original) The computer-readable medium of claim 9, wherein the software further comprises instructions for generating a bowtie plot from said adjusted data.
- 11. (Original) The computer-readable medium of claim 8, wherein the software further comprises instructions for selecting said DT-MRI data to represent an initial estimate of said diffusion tensor value.
- 12. (Original) The computer-readable medium of claim 8, wherein the software further comprises instructions for selecting said DT-MRI data to represent echo data from which an initial estimate of the diffusion tensor can be derived.

13. (Original) The computer-readable medium of claim 8, wherein the instructions for determining a first value comprise instructions for determining an average intra-subject variance.

- 14. (Original) The computer-readable medium of claim 8, wherein the instructions for determining a second value comprise instructions for determining an inter-subject variance.
- 15. (Currently Amended) A system for estimating a value of a diffusion tensor, said system comprising:

an MRI machine;

a processor in data communication with the MRI machine;

a computer-readable medium in data communication with the processor, the computer-readable medium having encoded thereon software [as recited in claim 9-] for estimating a value of a diffusion tensor, said software comprising instructions for:

obtaining, from a plurality of test subjects, DT-MRI data from which an initial estimate of the tensor can be derived:

determining a first value indicative of intra-subject variation in said data;

determining a second value indicative of inter-subject variation in said data; and

at least in part on the basis of said first and second values, determining a subject-specific additive offset for adjusting said DT-MRI data.
